

# ml\_dev - Machine Learning Development Image

---

This image supports the use of a Docker container for the development of Machine Learning projects in an Ubuntu environment.

## Table of Contents

- 1. Installed core components**
  - 2. Creating a new Machine Learning development container**
  - 3. Working with an existing Machine Learning development container**
  - 4. Best practices**
- 

## 1. Installed core components

With the following command you can check in detail which software versions are included in the Docker image:

```
apt list --installed
```

### Version 1.1.1

Component	Version	Remark	Status
asdf	v0.8.1-a1ef92a		
curl	7.68.0		base version
Docker Compose	1.29.2		
Docker Engine	20.10.8		upgrade
dos2unix	7.4.0		base version
Eclipse	2021-06-R		
GCC & G++	10.3.0		
Git	2.32.0		
GNU Autoconf	2.69		base version
GNU Automake	1.16.1		base version
GNU Make	4.2.1		base version
Gradle	7.2		
htop	3.0.5		
ImageMagick	7.1.0-4		upgrade

Component	Version	Remark	Status
Java	16.0.2	openjdk	upgrade
Julia	1.6.2		upgrade
LCOV	1.14		base version
OpenSSL	1.1.1.f		base version
Python	3.9.6		
- alpha_vantage	2.3.1		
- fire	0.4.0		
- Keras	2.6.0		upgrade
- matplotlib	3.4.3		upgrade
- numpy	1.19.5		
- pandas	1.3.1		upgrade
- pip	21.2.4		upgrade
- PyYAML	5.4.1		
- requests	2.26.0		upgrade
- scikit-learn	0.24.2		
- scipy	1.7.1		upgrade
- seaborn	0.11.1		
- statsmodels	0.12.2		
- tensorflow	2.6.0		upgrade
- Theano	1.0.5		
R	4.1.1		upgrade
- caret	6.0.88		
- knitr	1.33		
- rmarkdown	2.10		upgrade
- tidymodels	0.1.3		
- rsample	0.1.0		
- parsnip	0.1.7		upgrade
- recipes	0.1.16		
- workflows	0.2.3		upgrade
- tune	0.1.6		upgrade

Component	Version	Remark	Status
- yardstick	0.0.8

R	4.0.3		
RStudio	1.3.1093	for virtual machine only	
Ubuntu	20.04	focal	
Vim	8.1		

## 2. Creating a new Machine Learning development container

### 2.1 Getting started

```
> REM Assumptions:
> REM   - the name of the Docker container should be: my_ml_dev
> REM   - the path the host repository is: //C/projects/my_repro
> REM   - the directory name for this repository inside the container should be:
my_repro_dir
> REM   - you want to use the latest version of the Konnexions development image
> docker run --name my_ml_dev \
    -v //C/projects/my_repro:/my_repro_dir \
    konnexionsgmbh/ml_dev:latest

> REM Stopping the container
> docker stop my_ml_dev

> REM Restarting the container
> docker start my_ml_dev

> REM Entering a running container
> docker exec -it my_ml_dev bash
```

### 2.2 Detailed syntax

A new container can be created with the **docker run** command.

#### Syntax:

```
docker run -it
    [--name <container_name>] \
    konnexionsgmbh/ml_dev[:<version>]
    [<cmd>]
```

**Parameters:**

- **container\_name** - an optional container identification
- **directory\_repository** - an optional host repository directory - the default value is expecting the repository inside the container
- **version** - an optional version number of the image or the constant **latest**
- **cmd** - an optional command to be executed in the container, default is **bash** for running the **bash** shell

Detailed documentation for the command **docker run** can be found [here](#).

**Examples:**

1. Creating a new Docker container named **my\_ml\_dev** using a repository inside the Docker container:

```
docker run -it --name my_ml_dev konnexionsgmbh/ml_dev:latest
```

2. Creating a new Docker container named **my\_ml\_dev** using the host repository of a Windows directory **D:\projects\my\_repro**:

```
docker run -it --name my_ml_dev -v //D/projects/my_repro:/my_repro konnexionsgmbh/ml_dev:latest
```

3. Creating a new Docker container named **my\_ml\_dev** using the host repository of a Linux directory **/my\_repro**:

```
docker run -it --name my_ml_dev -v /my_repro:/my_repro konnexionsgmbh/ml_dev:latest
```

## 3. Working with an existing Machine Learning development container

### 3.1 Starting a stopped container

A previously stopped container can be started with the **docker start** command.

**Syntax:**

```
docker start <container_name>
```

**Parameter:**

- **container\_name** - the mandatory container identification, that is an UUID long identifier, an UUID short identifier or a previously given name

Detailed documentation for the command **docker start** can be found [here](#).

### 3.2 Entering a running container

A running container can be entered with the **docker exec** command.

**Syntax:**

```
docker exec -it <container_name> <cmd>
```

**Parameter:**

- **container\_name** - the mandatory container identification, that is an UUID long identifier, an UUID short identifier or a previously given name
- **cmd** - the command to be executed in the container, e.g. **bash** for running the **bash** shell

Detailed documentation for the command **docker exec** can be found [here](#).

## 4. Best practices

### 4.1 Use of a root repository directory on the host computer

If all relevant repositories are located within a common parent directory, then development work in all these repositories can be done within a single Konnexions development container.

**Example:**

In the following example we assume that the host directory is named **C:\Temp\my\_projects** and should be mapped to the **projects** directory in the container.

```
>C:\Temp\my_projects>docker run -it --name ml_dev -v  
//C/Temp/my_projects:/projects konnexionsgmbh/ml_dev:latest  
root@35b9310932f1:/# cd projects  
root@35b9310932f1:/projects# ls -ll  
total 0
```

### 4.2 Use of private GitHub repositories inside the container

To access private repositories in GitHub, you must first create a new personal access token in GitHub and then add it to your git configuration inside the container.

#### 1. Create a new personal access token in GitHub

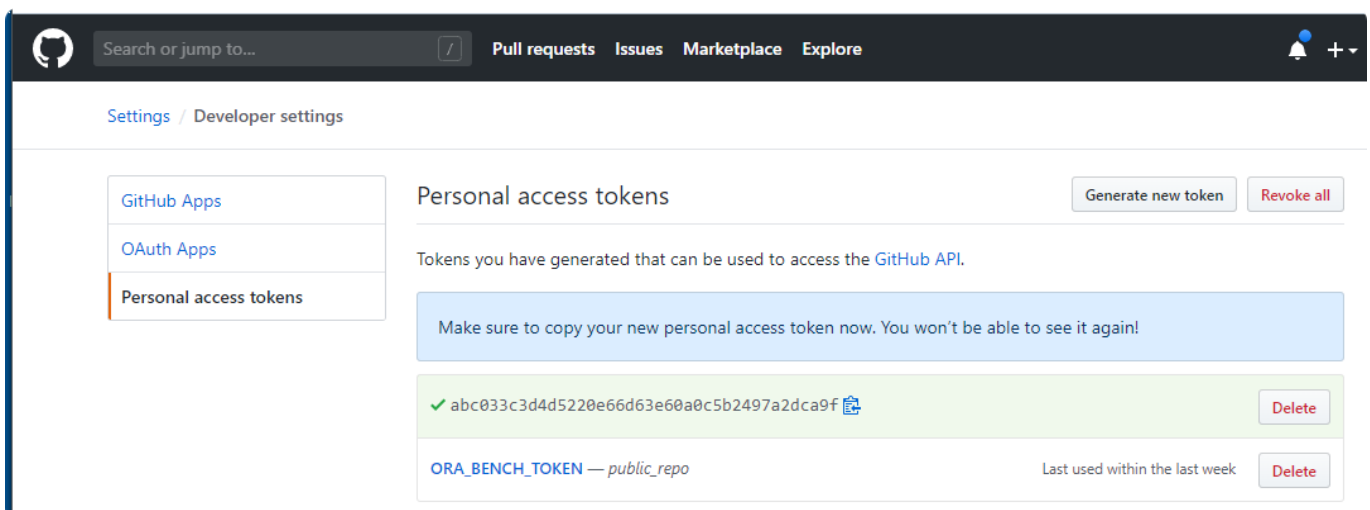

- With the following URL you can create the access token: <https://github.com/settings/tokens>

- Press the button **Generate new token**

- Name the new token, select the scopes and press the button **Generate token**

- Write down the secret code and keep it in a safe place

## 2. Setting up the Docker container on the host machine

In the following example we assume that the host directory is named `C:\Temp\my_projects` and should be mapped to the `projects` directory in the container.

```
C:\Temp\my_projects>docker run -it --name ml_dev -v //C/Temp/my_projects:/projects
konnexionsgmbh/ml_dev:latest
Unable to find image 'konnexionsgmbh/ml_dev:latest' locally
latest: Pulling from konnexionsgmbh/ml_dev
d51af753c3d3: Pull complete
...
a6bb30d1a5cf: Pull complete
Digest: sha256:5f6d6afc566ef9142d2d85b85dd331c0558eafaaf286179fd0ae787988c1b89b
Status: Downloaded newer image for konnexionsgmbh/ml_dev:latest
```

## 3. Initial configuration of git in the container

```
root@332206c300f1:/# export XDG_CONFIG_HOME=/projects
root@332206c300f1:/# mkdir -p $XDG_CONFIG_HOME/git/
root@332206c300f1:/# touch $XDG_CONFIG_HOME/git/config
root@332206c300f1:/# touch $XDG_CONFIG_HOME/git/credentials
root@332206c300f1:/# git config --file=$XDG_CONFIG_HOME/git/config
credential.helper 'store --file=/projects/git/credentials'
root@332206c300f1:/# git config --file=$XDG_CONFIG_HOME/git/config user.name "John
Doe"
root@332206c300f1:/# git config --file=$XDG_CONFIG_HOME/git/config user.email
"john.doe@company.com"
root@332206c300f1:/# git config --list --show-origin
file:/projects/git/config          credential.helper=store --
file=/projects/git/credentials
file:/projects/git/config          user.name=John Doe
file:/projects/git/config          user.email=john.doe@company.com
```

## 4. Verification of the settings

```
root@332206c300f1:/# cat /projects/git/config
[credential]
    helper = store --file=/projects/git/credentials
[user]
    name = John Doe
[user]
    email = john.doe@company.com
```

## 5. Clone a repository for the first time

When prompted provide your github user name and the new personal access token from (1).

```
root@332206c300f1:/# cd projects
root@332206c300f1:~# git clone https://github.com/KonnexionsGmbH/docker_images
Cloning into 'docker_images'...
Username for 'https://github.com': John Doe
Password for 'https://john.doe@company.com':
abc033c3d4d5220e66d63e60a0c5b2497a2dca9f
remote: Enumerating objects: 78, done.
remote: Counting objects: 100% (78/78), done.
remote: Compressing objects: 100% (49/49), done.
remote: Total 78 (delta 33), reused 68 (delta 23), pack-reused 0
Receiving objects: 100% (78/78), 167.83 KiB | 867.00 KiB/s, done.
Resolving deltas: 100% (33/33), done.
```

## 6. Verify if the clone completed with success

```
root@332206c300f1:~# cat /projects/git/credentials
https://John Doe:abc033c3d4d5220e66d63e60a0c5b2497a2dca9f@github.com
```

## 7. Verification after a restart of the Docker container

```
C:\Temp\my_projects>docker start ml_dev
ml_dev
C:\Temp\my_projects>docker exec -it ml_dev bash
root@332206c300f1:/# export XDG_CONFIG_HOME=/projects
root@332206c300f1:/# git config --list --show-origin
file:/projects/git/config credential.helper=store --
file=/projects/git/credentials
file:/projects/git/config user.name=John Doe
file:/projects/git/config user.email=john.doe@company.com
```

## 8. Verification after the removal of the Docker container

- Deleting the Docker container and image

```
C:\Temp\my_projects>docker stop ml_dev
ml_dev

C:\Temp\my_projects>docker rm ml_dev
ml_dev

C:\Temp\my_projects>docker images
REPOSITORY          TAG                 IMAGE ID            CREATED
SIZE
```

```

```

- If we use the same path - where `git/config` and `git/credentials` exist - as in Step 4, `git` access (clone/push/pull) doesn't ask for username/password anymore.
