

# H2 Database Engine Image

---

These images support the operational use of H2 Database Engine Docker containers.

## 1. Creating a new H2 Database Engine container

### 1.1 Getting started

```
> REM Assumptions:
> REM   - you want to map the container port 9092 to the host port 8000
> REM   - the name of the Docker container should be: my_h2_db
> REM   - the path the host repository is: //C/projects/my_database
> REM   - you want to use the latest version of the H2 Database Engine image
> docker run -it -p 8000:9092 \
    --name my_h2_db \
    -v //C/projects/my_database:/dbs \
    konnexionsgmbh/h2_database_engine:latest

> REM Stopping the container
> docker stop my_h2_db

> REM Restarting the container
> docker start my_h2_db

> REM Entering a running container
> docker exec -it my_h2_db bash
```

### 1.2 Detailed Syntax

A new container can be created with the **docker run** command.

#### Syntax:

```
docker run -it
    [-p <port>:9092] \
    [--name <container_name>] \
    [-v <directory_repository>:/dbs] \
    konnexionsgmbh/h2_database_engine[:<version>]
    [<cmd>]
```

#### Parameters:

- **port** - an optional listener port
- **container\_name** - an optional container identification

- **directory\_repository** - an optional host database directory - the default value is expecting the database inside the container
- **version** - an optional version number of the image or the constant **latest**
- **cmd** - an optional command to be executed in the container, default is **bash** for running the **bash** shell

Detailed documentation for the command **docker run** can be found [here](#).

#### Examples:

1. Creating a new Docker container named **my\_h2\_db** using a database inside the Docker container:

```
docker run -it --name my_h2_db konnexionsgmbh/h2_database_engine:latest
```

2. Creating a new Docker container named **my\_h2\_db** using the database of a Windows directory **D:\projects\my\_database**:

```
docker run -it --name dderl_dev -v //D/projects/my_database:/dbs  
konnexionsgmbh/h2_database_engine:latest
```

3. Creating a new Docker container named **my\_h2\_db** using the host database of a Linux directory **/my\_database** and mapping port **8000** to port **9092**:

```
docker run -it --name my_h2_db -p 8000:9092 -v /my_database:/dbs  
konnexionsgmbh/h2_database_engine:latest
```

## 2 Working with an existing H2 Database Engine container

### 2.1 Starting a stopped container

A previously stopped container can be started with the **docker start** command.

#### Syntax:

```
docker start <container_name>
```

#### Parameter:

- **container\_name** - the mandatory container identification, that is an UUID long identifier, an UUID short identifier or a previously given name

Detailed documentation for the command **docker start** can be found [here](#).

### 2.2 Entering a running container

A running container can be entered with the **docker exec** command.

#### Syntax:

```
docker exec -it <container_name> <cmd>
```

**Parameter:**

- **container\_name** - the mandatory container identification, that is an UUID long identifier, an UUID short identifier or a previously given name
- **cmd** - the command to be executed in the container, e.g. **bash** for running the **bash** shell

Detailed documentation for the command **docker exec** can be found [here](#).

### 3 Installed packages

With the following command you can check in detail which package versions are included in the Docker image:

```
apk info --vv
```
