README.md 6/11/2021

DBSeeder Development and Operational Image

This image supports the use of a Docker container for the development and operation of DBSeeder in an Ubuntu environment.

Table of Contents

- 1. Installed core components
- 2. Creating a new DBSeeder container
- 3. Working with an existing DBSeeder container

1. Installed core components

With the following command you can check in detail which software components in which versions are included in the Docker image:

```
apt list --installed
```

Version 2.9.1

Component	Version	Remark	Status
Docker Engine	20.10.7		
Eclipse	2021-03-R		
Git	2.31.1		
Gradle	7.0.2		
Java	15.0.2	openjdk	
Ubuntu	20.04.2 LTS	focal	
Vim	8.2.2949		

2. Creating a new DBSeeder container

2.1 Getting started

- > REM Assumptions:
- > REM you want to map the container port 8443 to the host port 443
- > REM the name of the Docker container should be: my db seeder
- > REM the path the host repository is: //C/projects/my_repro
- > REM the directory name for this repository inside the container should be: my_repro_dir

README.md 6/11/2021

2.2 Detailed Syntax

A new container can be created with the docker run command.

Syntax:

```
docker run -it
    [-p <port>:8443] \
    [--name <container_name>] \
    konnexionsgmbh/db_seeder[:<version>]
    [<cmd>]
```

Parameters:

- port an optional listener port
- **container_name** an optional container identification
- directory_repository an optional host repository directory the default value is expecting the repository inside the container
- version an optional version number of the image or the constant latest
- cmd an optional command to be executed in the container, default is bash for running the bash shell

Detailed documentation for the command docker run can be found here.

Examples:

1. Creating a new Docker container named my_db_seeder using a repository inside the Docker container:

```
docker run -it --name my_db_seeder konnexionsgmbh/db_seeder:latest
```

2. Creating a new Docker container named my_db_seeder using the host repository of a Windows directory D:\projects\my_repro:

README.md 6/11/2021

```
docker run -it --name db_seeder -v //D/projects/my_repro:/my_repro
konnexionsgmbh/db_seeder:latest
```

3. Creating a new Docker container named my_db_seeder using the host repository of a Linux directory /my_repro and mapping port 8443 to port 8000:

```
docker run -it --name my_db_seeder -p 8000:8443 -v /my_repro:/my_repro
konnexionsgmbh/db_seeder:latest
```

3 Working with an existing DBSeeder container

3.1 Starting a stopped container

A previously stopped container can be started with the docker start command.

Syntax:

```
docker start <container_name>
```

Parameter:

• **container_name** - the mandatory container identification, that is an UUID long identifier, an UUID short identifier or a previously given name

Detailed documentation for the command docker start can be found here.

3.2 Entering a running container

A running container can be entered with the docker exec command.

Syntax:

```
docker exec -it <container_name> <cmd>
```

Parameter:

- **container_name** the mandatory container identification, that is an UUID long identifier, an UUID short identifier or a previously given name
- cmd the command to be executed in the container, e.g. bash for running the bash shell

Detailed documentation for the command docker exec can be found here.
