# kxn\_dev: Konnexions' Development Image

This image supports the use of a Docker container for the further development of the Konnexions' projects in an Ubuntu environment.

### **Table of Contents**

- 1. Installed core components
- 2. Creating a new Konnexions development container
- 3. Working with an existing Konnexions development container
- 4. Best practices
- **5. Development Project Specifics**

## 1. Installed core components

With the following command you can check in detail which software versions are included in the Docker image:

Component	Version	Remark	Status
Alien	8.95		
asdf	v0.8.1-a1ef92a		
CMake	3.20.5		upgrade
cURL	7.77.0		
Docker Compose	1.29.2		
Docker Engine	20.10.7		
Eclipse	2021-06-R		upgrade
Elixir	1.12.2-otp-24		upgrade
Erlang/OTP	24.0.3		upgrade
GCC & G++	10.3.0		upgrade
Git	2.32.0		
GNU Autoconf	2.71		
GNU Automake	1.16.3		
			<u> </u>

Component	Version	Remark	Status
GNU make	4.3		
Go	1.16.3		
Gradle	7.1.1		upgrade
htop	3.0.5		
Java	16.0.1	openjdk	
Julia	1.6.1		new
Kotlin	1.5.20		upgrade
LCOV	1.14		
nginx	1.18.0		
Node.js [npm]	v14.17.2 [6.14.13]		upgrade
OpenSSL	1.1.1k		
Oracle Instant Client	21.1.0.0.0		
Python	3.9.6		upgrade
- cx_Oracle	8.2.1		
- pip	21.1.3		
- pyyaml	5.4.1		upgrade
rebar3	3.16.1		
Rust	1.53.0		upgrade
tmux	3.2a		
Ubuntu	20.04.2 LTS	focal	
Vim	8.2.3083		upgrade
wget	1.21.1		
Yarn	1.22.10		

Component	Version	Remark	Status
Alien	8.95		
asdf	v0.8.1-a1ef92a		
CMake	3.20.3		upgrade
cURL	7.77.0		upgrade

Component	Version	Remark	Status
Docker Compose	1.29.2		
Docker Engine	20.10.7		upgrade
Eclipse	2021-03-R		
Elixir	1.12.1-otp-24		upgrade
Erlang/OTP	24.0.2		upgrade
GCC & G++	10.2.0		
Git	2.32.0		upgrade
GNU Autoconf	2.71		
GNU Automake	1.16.3		
GNU make	4.3		
Go	1.16.5		upgrade
Gradle	7.0.2

## 2. Creating a new Konnexions development container

## 2.1 Getting started

```
> REM Assumptions:
> REM - you want to map the container port 8443 to the host port 443
        - the name of the Docker container should be: my_kxn_dev
> REM - the path the host repository is: //C/projects/my_repro
> REM - the directory name for this repository inside the container should be:
my_repro_dir
        - you want to use the latest version of the Konnexions development image
> REM
> docker run -it -p 443:8443 \
             --name my_kxn_dev \
             -v //C/projects/my_repro:/my_repro_dir \
             konnexionsgmbh/kxn_dev:latest
> REM Stopping the container
> docker stop my_kxn_dev
> REM Restarting the container
> docker start my_kxn_dev
> REM Entering a running container
> docker exec -it my_kxn_dev bash
```

## 2.2 Detailed Syntax

A new container can be created with the docker run command.

#### Syntax:

```
docker run -it
    [-p <port>:8443] \
    [--name <container_name>] \
    [-v <directory_repository>:/dderl] \
    konnexionsgmbh/kxn_dev[:<version>]
    [<cmd>]
```

#### **Parameters:**

- port an optional listener port
- container\_name an optional container identification

 directory\_repository - an optional host repository directory - the default value is expecting the repository inside the container

- version an optional version number of the image or the constant latest
- cmd an optional command to be executed in the container, default is bash for running the bash shell

Detailed documentation for the command docker run can be found here.

#### **Examples:**

1. Creating a new Docker container named my\_kxn\_dev using a repository inside the Docker container:

```
docker run -it --name my_kxn_dev konnexionsgmbh/kxn_dev:latest
```

2. Creating a new Docker container named my\_kxn\_dev using the host repository of a Windows directory D:\projects\my\_repro:

```
docker run -it --name dderl_dev -v //D/projects/my_repro:/my_repro
konnexionsgmbh/kxn_dev:latest
```

3. Creating a new Docker container named my\_kxn\_dev using the host repository of a Linux directory /my\_repro and mapping port 8443 to port 8000:

```
docker run -it --name my_kxn_dev -p 8000:8443 -v /my_repro:/my_repro
konnexionsgmbh/kxn dev:latest
```

- 3. Working with an existing Konnexions development container
- 3.1 Starting a stopped container

A previously stopped container can be started with the docker start command.

### Syntax:

```
docker start <container_name>
```

#### Parameter:

• **container\_name** - the mandatory container identification, that is an UUID long identifier, an UUID short identifier or a previously given name

Detailed documentation for the command docker start can be found here.

## 3.2 Entering a running container

A running container can be entered with the docker exec command.

#### Syntax:

```
docker exec -it <container_name> <cmd>
```

#### Parameter:

- **container\_name** the mandatory container identification, that is an UUID long identifier, an UUID short identifier or a previously given name
- cmd the command to be executed in the container, e.g. bash for running the bash shell

Detailed documentation for the command docker exec can be found here.

## 4. Best practices

## 4.1 Use of a root repository directory on the host computer

If all relevant repositories are located within a common parent directory, then development work in all these repositories can be done within a single Konnexions development container.

### **Example:**

In the following example we assume that the host directory is named C:\Temp\my\_projects and should be mapped to the projects directory in the container.

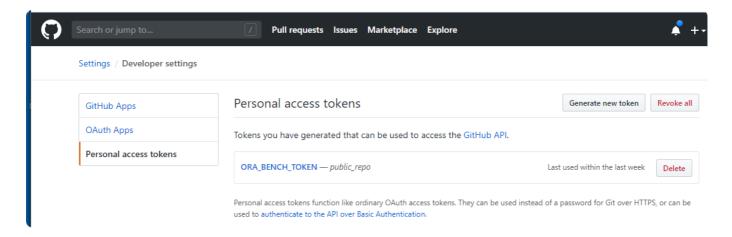

```
>C:\Temp\my_projects>docker run -it --name kxn_dev -v
//C/Temp/my_projects:/projects konnexionsgmbh/kxn_dev:latest
root@35b9310932f1:/# cd projects
root@35b9310932f1:/projects# ls -ll
total 0
drwxrwxrwx 1 root root 4096 May 2 14:05 dderl
```

## 4.2 Use of private GitHub repositories inside the container

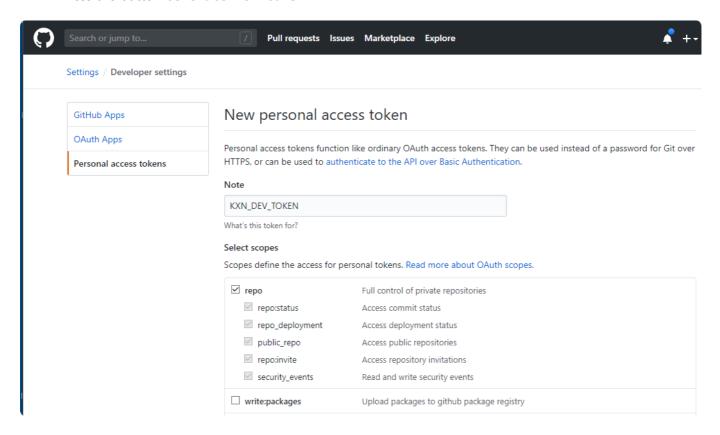

To access private repositories in GitHub, you must first create a new personal access token in GitHub and then add it to your git configuration inside the container.

### 1. Create a new personal access token in GitHub

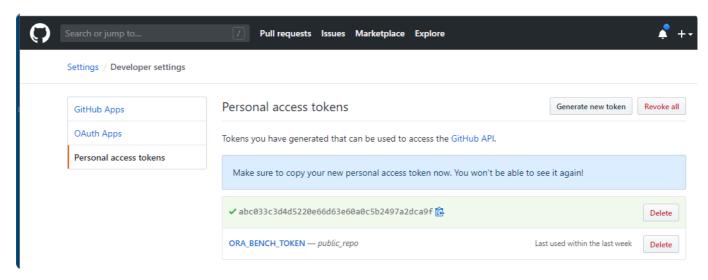

• With the following URL you can create the access token: https://github.com/settings/tokens

Press the button Generate new token

Name the new token, select the scopes and press the button Generate token

• Write down the secret code and keep it in a safe place

### 2. Setting up the Docker container on the host machine

In the following example we assume that the host directory is named C:\Temp\my\_projects and should be mapped to the projects directory in the container.

```
C:\Temp\my_projects\dderl>docker run -it --name kxn_dev -v
//C/Temp/my_projects:/projects konnexionsgmbh/kxn_dev:latest
Unable to find image 'konnexionsgmbh/kxn_dev:latest' locally
latest: Pulling from konnexionsgmbh/kxn_dev
d51af753c3d3: Pull complete
...
a6bb30d1a5cf: Pull complete
Digest: sha256:5f6d6afc566ef9142d2d85b85dd331c0558eafaaf286179fd0ae787988c1b89b
Status: Downloaded newer image for konnexionsgmbh/kxn_dev:latest
```

### 3. Initial configuration of git in the container

```
root@332206c300f1:/# export XDG_CONFIG_HOME=/projects
root@332206c300f1:/# mkdir -p $XDG_CONFIG_HOME/git/
root@332206c300f1:/# touch $XDG CONFIG HOME/git/config
root@332206c300f1:/# touch $XDG_CONFIG_HOME/git/credentials
root@332206c300f1:/# git config --file=$XDG_CONFIG_HOME/git/config
credential.helper 'store --file=/projects/git/credentials'
root@332206c300f1:/# git config --file=$XDG_CONFIG_HOME/git/config user.name "John
Doe"
root@332206c300f1:/# git config --file=$XDG_CONFIG_HOME/git/config user.email
"john.doe@company.com"
root@332206c300f1:/# git config --list --show-origin
file:/projects/git/config
                              credential.helper=store --
file=/projects/git/credentials
file:/projects/git/config user.name=John Doe
file:/projects/git/config
                               user.email=john.doe@company.com
```

## 4. Verification of the settings

```
root@332206c300f1:/# cat /projects/git/config
[credential]
    helper = store --file=/projects/git/credentials
[user]
    name = John Doe
[user]
    email = john.doe@company.com
```

### 5. Clone a repository for the first time

When prompted provide your github user name and the new personal access token from (1).

```
root@332206c300f1:/# cd projects
root@332206c300f1:~# git clone https://github.com/KonnexionsGmbH/docker_images
Cloning into 'docker_images'...
Username for 'https://github.com': John Doe
Password for 'https://john.doe@company.com':
abc033c3d4d5220e66d63e60a0c5b2497a2dca9f
remote: Enumerating objects: 78, done.
remote: Counting objects: 100% (78/78), done.
remote: Compressing objects: 100% (49/49), done.
remote: Total 78 (delta 33), reused 68 (delta 23), pack-reused 0
Receiving objects: 100% (78/78), 167.83 KiB | 867.00 KiB/s, done.
Resolving deltas: 100% (33/33), done.
```

### 6. Verify if the clone completed with success

```
root@332206c300f1:~# cat /projects/git/credentials
https://John Doe:abc033c3d4d5220e66d63e60a0c5b2497a2dca9f@github.com
```

#### 7. Verification after a restart of the Docker container

```
C:\Temp\my_projects\dderl>docker start kxn_dev
kxn_dev
C:\Temp\my_projects\dderl>docker exec -it kxn_dev bash
root@332206c300f1:/# export XDG_CONFIG_HOME=/projects
root@332206c300f1:/# git config --list --show-origin
file:/projects/git/config credential.helper=store --
file=/projects/git/credentials
file:/projects/git/config user.name=John Doe
file:/projects/git/config user.email=john.doe@company.com
```

### 8. Verification after the removal of the Docker container

Deleting the Docker container and image

```
C:\Temp\my_projects\dderl>docker stop kxn_dev
kxn_dev

C:\Temp\my_projects\dderl>docker rm kxn_dev
kxn_dev

C:\Temp\my_projects\dderl>docker images
REPOSITORY TAG IMAGE ID CREATED
SIZE
```

```
konnexionsgmbh/kxn_dev latest 51757b5e414e 6 hours ago 3.71GB

C:\Temp\my_projects\dderl>docker rmi 51757b5e414e

Resolving deltas: 100% (33/33), done.
```

• If we use the same path - where git/config and git/credentials exist - as in Step 3, git access
(clone/push/pull) doesn't ask for username/password anymore.

## 5. Development Project Specifics

### 5.1 DDErl

Inside the Docker container you can either clone a dderl repository or switch to an existing dderl repository. If a Docker container with an Oracle database is located on the host computer it can be accessed by using the IP address of the host computer. Any dderl script can be executed inside the Docker container, for example:

```
rebar3 compile
rebar3 as prod release
./start.sh
```

The following port numbers are exposed and can be mapped if necessary:

```
1236
7000-7020
8125
8443
9443
```

### 5.2 OraBench

Inside the Docker container you can either clone a ora\_bench repository or switch to an existing ora\_bench repository.

If there is a docker container with an Oracle database on the host computer, it can be accessed in two ways:

- 1. via the IP address of the host computer,
- 2. via the docker network ora\_bench\_net the development container kxn\_dev must be included in this network beforehand

Any ora\_bench script can be executed inside the Docker container, for example:

```
./scripts/run_properties_standard.sh > run_properties_standard.log 2>&1
```

**Important:** If the repository was previously used on Windows, then all files in the following directories must also be deleted from Windows first:

- src\_elixir/deps
- src\_elixir/mix.lock
- src\_erlang/\_build
